                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to treating a patient having osteoporosis comprising administering a cyclase inhibiting parathyroid hormone peptide (CIP) or its conservatively substituted variant exhibiting a parathyroid hormone (PTH, which regulates extracellular calcium levels) antagonist activity to reduce the occurrence of hypercalcaemia or osteosarcoma in the patient resulting from the administration of CAP. The peptide comprises PTH3-84, PHH3-84, PHH3-84 and PTH3-84 (appearing as ABG74230 -ABG74233). The present sequence is the CIP PTH3-84.
                                                                                    between a person having substantially normal parathyroid function and having hyperparathyroidism. The method comprises determining and comparing at least two of the following parameters: whole parathyroid hormone level, parathyroid hormone inhibitory peptide fragment level and total parathyroid hormone level. The method is used for monitoring (treatments of) parathyroid related bone disease and the effects of
                                   The present sequence represents a fragment of human parathyroid hormone (PTH), comprising residues 34-84, which functions as a PTH antagonist. The specification describes a method for differentiating
                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Parathyrold hormone; PTH; cyclase activating parathyrold hormone; CAP; cyclase inhibiting parathyrold hormone; CIP; osteoporosis; hypercalcaemia; osteosarcoma; extracellular calcium; PTH3-84.

The invention relates to treating a patient having osteoporosis comprising administering a cyclase inhibiting parathyroid hormone (CIP) or its conservatively substituted variant exhibiting a parathyroid hormone (PTH, which regulates extracellular calcium levels) antagonist activity to reduce the occurrence of hypercalcaemia or osteosarcoma in the patient resulting from the administration of CAP. The peptide comprises PTH2-84, PTH3-84 and PTH28-84 (appearing as ABG74230 Note: This peptide (SEQ ID 8) is included in the sequence listing but is not referred to anywhere else in the specification. However it does represents PTH amino acids 28-84 (unlike ABG74233 which is referred to as represents 28-84 (unlike ABG74233 which is referred to as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       PTH28-84 but is actually PTH7-84 and is claimed as being PTH28-34) it is therefore unclear whether the present peptide or the peptide appearing as ABG74233 is actually intended to be claimed.
                                                                                                                                                                                                                                                                                                                                                                                                 Treating a patient having osteoporosis and is being administered cyclase activating parathyroid hormone or its analogue comprises administering a cyclase inhibiting parathyroid hormone peptide .
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               FVALGAPLAPRDAGSQRPRKKEDNVLVESHEKSLGEANKADVNVLTKAKSQ 57

hormone (PTH), comprising residues 3.84, which functions as a PTH antagonist. The specification describes a method for differentiating between a person having substantially normal parathyroid function and having hyperparathyroidsm. The method comprises determining and comparing at least two of the following parameters: whole parathyroid hormone level. The method is used for monitoring and total parathyroid hormone inhibitory peptide fragment level and total parathyroid hormone level. The method is used for monitoring (treatments of) parathyroid related bone disease and the effects of therapeutic treatment for hyperparathyroidism.
                                                                                                                                                                                                                                                                               Differentiating between normal parathyroid function and hyperparathyroidism comprises determining and comparing whole parathyroid hormone, parathyroid hormone inhibitory peptide fragment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Parathyroid hormone; PTH; cyclase activating parathyroid hormone; CAP; cyclase inhibiting parathyroid hormone; CIP; osteoporosis; hypercalcaemia; osteosarcoma; extracellular calcium; PTH34-84.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to treating a patient having osteoporosis comprising administering a cyclase inhibiting parathyroid hormone peptide (CIP) or its conservatively substituted variant exhibiting a parathyroid hormone (PIH, which regulates extracellular calcium levels) antagonist
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   activity to reduce the occurrence of hypercalcaemia or osteosarcoma in the patient resulting from the administration of CAP. The peptide comprises PTH2-84, PTH3-84 and PTH28-84 (appearing as ABG74230 -ABG74233). The present sequence is the CIP PTH28-84.

Note: This peptide is referred to in the specification as PTH28-34 but actually represents amino acids 7-84 of PTH. It is therefore unclear whether this peptide (SEQ ID 4) or the peptide appearing as ABG74237 (Which does represent amino acids 28-84 of PTH) is actually intended to

substantially normal parathyroid function and having hyperparathyroidism. The method comprises determining and comparing at least two of the following parameters: whole parathyroid hormone level, parathyroid hormone inhibitory peptide fragment level and total parathyroid hormone level. The method is used for monitoring (treatments of) parathyroid related bone disease and the effects of therapeutic treatment for

                                                                                                                                                                                                                                                                                                                          ö
                                                                    peptide
                                       The invention relates to treating a patient having osteoporosis comprising administering a cyclase inhibiting parathyroid hormone peptide (CIP) or its conservatively substituted variant exhibiting a parathyroid hormone (PTH, which regulates extracellular calcium levels) antagonist activity to reduce the occurrence of hypercalcaemia or osteosarcoma in the patient resulting from the administration of CAP. The peptide comprises PTH2-84, PTH34-84, and PTH3-8-84 (appearing as ABG7423). The present sequence is the CIP PTH34-84.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to treating a patient having osteoporosis comprising administering a cyclase inhibiting parathyroid hormone peptide (CIP) or its conservatively substituted variant exhibiting a parathyroid hormone (PIH, which regulates extracellular calcium levels) antagonist
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             as ABG74230
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             activity to reduce the occurrence of hypercalcaemia or osteosarcoma in the patient resulting from the administration of CAP. The peptide comprises PTH2-84, PTH34-84, PTH3-84 and PTH28-84 (appearing as ABG7422-ABG74233). The present sequence is the CIP PTH2-84.

```
The sequences given in AAW08103-07 represent fragments of human parathroad hormone (PTH) Which were used as Xaa34 in the generic sequence given in AAW08102. Peptides based on the generic sequence are human PTH (1-34) derivative peptides. They have potent cAMP-producing activity and be been formation activity. They may be used in treatment of bone diseases including osteoporosis, hypoparathyroidism, hypertension and climacteric disturbance. The peptides are low in toxicity and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Codons 29-84 are degenerate in the usage frequency favoured by E.coli or yeast. Codons 1-28 (see AAQ11617) are designed to contain adenine rich codons. The sequence is prepd. from eight oilgonuclectides (4 on each strand). A plasmid contg. the complete sequence expresses PTH with an improved yield. The sequence expresses PTH with an improved yield. The is a blood (Updated on 25-MRR-2003 to correct PR field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Mature human parathyroid synthesis - includes using eg E. colitransformed by plasmid contg. synthetic nucleotide sequence contg. adenine rich codons in N-terminal region.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to treating a patient having osteoporosis comprising administering a cyclase inhibiting parathyroid hormone peptide (CIP) or its conservatively substituted variant exhibiting a parathyroid hormone (PTH, which regulates extracellular calcium levels) antagonist activity to reduce the occurrence of hypercalcaemia or osteosarcoma in the patient resulting from the administration of CAP. The peptide comprises PPH2-84, PTH34-84, PTH3-84 and PTH28-84 (appearing as ABG74230-ABG74233). The present sequence is full length human PTH, the sequence

```
The sequence is that of mutated human parathyroid hormone (hPTH) (7-84) where Met8 is substd. by Leu. It has higher stability, enhanced activity and improved absorption by tissues. It can act as a PTH antigonist and can be used as a therapeutic agent for hypercalcaemia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human parathyrold hormone; hPTH; PTH related peptide; PTHTP; eczema; hyperproliferative skin disorder; psoriasis; ichthyosis; skin cancer; acne; actinic keratosis; alopecia; gene therapy.
                                                                              Human parathyroid hormone, hPTH; antagonist; hypoparathyroidism;
hypercalcaemia.

The peptide can have higher stability, enhanced activity and improved absorption by tissues. It can act as a PTH antagonist and can be used as a therapeutic agent for hypercalcaemia and hyperparathyroidism. (Updated on 25-MAR-2003 to correct PN field.)

27-APR-2001; 2001WO-US13528

The invention relates to a method for regulating proliferation or enhancing differentiation of mammalian skin or hair cell. The method involves administering nucleic acids encoding peptides derived from Involves administering nucleic acids encoding peptides derived from N-terminal region of human parathyroid hormone (hPTH) or hPTH-related peptide (PTHP). The method is used for inhibiting hyperproliferative skin disorders such as sportasts, tothhyosis, eccens, acne, actinic regrowth. It is useful for stimulating cell growth, rejuvenating aged skin, preventing skin winkles, enables, treating skin winkles, enabancing wound chealing, stimulating hair growth, treating or preventing female or male pattern baldness, for treating chemotherapy induced alopecta and also for stimulating epidermal cell growth or hair follicle cell growth. The method is also used in gene therapy. ô Score 248; DB 23; Length 78; Pred. No. 7.6e-26; 1; Mismatches 0; Indels 0; Indels 78 AA; Sequence

Gaps 1 FVALGAPLAPRDAGSORPRKKEDNVLVESHEKSLGEANKADVNVLTKAKSO 51

The invention relates to a composition (I) comprising modulators of parathyroid hormone (PTH) and parathyroid hormone-related protein (PTHP) which comprises a PTH/PTHP modulating domain and a vehicle. (I) comprises a PTH agonist optionally with a bone resorption inhibitor, such as osteoprotegrin (OPG), OPG-L antibody, calcitonin, bisphosphonates, cestrogen receptor modulators and tibolone is useful for treating osteopenia. (I) is useful for therapeutic and prophylactic purposes. Antagonists of PTH receptor are useful in treating primary and secondary hyperthyroidism, hypercalcaemia, tumour metastases, particularly breast and prostate cancer, cachaita and anorexia, osteopenia, including various forms of osteoporosis, Paget's disease of bone, osteomyelitis, osteonecrosis or bone cell death, associated with firmment of the page of the pa disease, sickle cell anaemia, systemic lupus erythematosus, rheumatoid arthritis, periodontal disease and alopecia. PTH receptor agonists are useful as therapeutic agents in conditions including fracture repair (including healing of non-union fractures), osteopenia, including various forms of osteoperosis, AA0730181 represent parathyroid hormone and parathyroid hormone related protein (PTH/PTHIP) modulators and related amino acid sequences of the invention. Gaps Composition, useful for treating osteopenia, comprises parathyroid hormone and parathyroid hormone-related protein receptor modulators ö Length 78; Indels 98.0%; Score 248; DB 23; 98.0%; Pred. Arnold A., Horst S.A., Gardella T.J., Baba H., Levine M.A.,
Rronenberg H.M.;
Mutation of the signal peptide-encoding region of the
preproparathyroid hormone gene in familial isolated
hypoparathyroidism.";
J. Ciln. Invest. 86:1084-1087(1990).
I- FUNCTION: PTH ELEVATES CALCIUM LEVEL BY DISSOLVING THE SALTS IN
BONE AND PREVENTING THEIR RENAL EXCRETION.
I- DISEASE: Defects in PTH are a cause of familial isolated
hypoparathyroidism (FIH) [MIX:146200].
I- SIMILARITY: BELONGS TO THE PARATHYROID HORMONE FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            STRÜCTURE BY NMR OF 32-65.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         -i-SUBUNIT: MUSCLE MYOSIN IS A HEXAMERIC PROTEIN THAT CONSISTS OF 2 HEAVY CHAIN SUBUNITS (MHC), 2 ALKALI LIGHT CHAIN SUBUNITS (MLC)
AND 2 REGULATORY LIGHT CHAIN SUBUNITS (MLC-2).
-i-SUBCELLULAR LOCATION: THICK filaments of the myofibrils.
-i-DOMAIN: THE RODLIKE TAIL SEQUENCE IS HIGHLY REPETITIVE, SHOWING CYCLES OF A 20-RESIDUE REPEAT PATTERN COMPOSED OF 4 HEPTAPEPTIDES, CHARACTERISTIC FOR ALPHA-HELICAL COLLED COLLS.
-I-MISCELLANEOUS: EACH MYOSIN HEAVY CHAIN CAN BE SPLIT INTO 1 LIGHT MEROMYOSIN (LAM) AND I HEAVY MEROMYOSIN (HAM). IT CAN LAPER BE SPLIT FURTHER INTO 2 GLOBULAR SUBFRAGMENTS (SI) AND I ROD-SHAPED
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       SIMILARITY: THE PERIODICITIES OF HYDROPHOBIC AND CHARGED RESIDUES,

SUBCELLULAR LOCATION: Thick filaments of the myofibrils.
SUBCELLULAR LOCATION: Thick filaments of the myofibrils.
DOMAIN: THE RODLIKE TAIL SEQUENCE IS HIGHLY REPETITIVE, SHOWING CYCLES OF A 28-RESIDUE REPEAT PATTERN COMPOSED OF 4 HEPTAPEPTIDES, CHARACTERISTIC FOR ALPHA-HELICAL COLLED COLLS.
FIM. TWO CYSTEINE RESIDUES IN THE SI DOMAIN ARE SELECTIVELY ALKYLATED AND ARE REQUIRED FOR MYOSIN ATRASE ACTIVITY.
MISCELLANEOUS: EACH MYOSIN HEAVY CHAIN CAN BE SPLIT INTO 1 LIGHT WEROMYOSIN (LMM) AND 1 HEAVY MEROMYOSIN (HMM). IT CAN LATER BE SPLIT FURTHER INTO 2 GLOBULAR SUBFRAGMENTS (SI) AND 1 ROD-SHAPED
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

BIOL. Chem. 258:5196-5205(1983).
12. 3. BIOL. Chem. 258:5196-5205(1983).
13. SIOL. Chem. 258:5196-5205(1983).
14. SUBUNIT: MUSCLE MODIN IS A HEXAMERIC PROTEIN THAT CONSISTS OF 2 HEAVY CHAIN SUBUNITS (MHC), 2 ALKALI LIGHT CHAIN SUBUNITS (MLC).
15. STEGULATORY LIGHT CHAIN SUBUNITS (MLC-2).
16. SUBCELLULAR LOCATION: Thick filaments of the myofibrils.
17. SUBCELLULAR LOCATION: Thick filaments of the myofibrils.
18. SUBCELLULAR LOCATION: Thick filaments of the myofibrils.
19. CYCLES OF A 28 RESIDIOE REPEAT PATTERN COMPOSED OF 4 HEPTAPEPTIDES.
19. CHARACTERISTIC FOR ALPHA-HELICAL COLLED COLLED.
19. PTW. TWO CYSTEINE RESIDIES IN THE 51 DOMAIN ARE SELECTIVELY ALKYLAND AND ARE REDUIRED FOR MYOSIN APPASE ACTIVITY.
19. CHARACTERISTIC CHAM) AND ARE NEGULIED.
20. HISCELLANDOUS: EACH MYOSIN HEAVY CHAIN CAN BE SPLIT INTO 1 LIGHT MEROMYOSIN (LAM) AND 1 HEAVY MEROMYOSIN (HMM). IT CAN LAFER BE SPLIT INTO 2 GLOBULAR SUBFRAGMENTS (S1) AND 1 ROD-SHAPED.
                                                                                                                                                                                                                                                                                                                                                                                                                                  SEQUENCE OF 1502-1940 FROM N.A.
